

Built-in Heading Tags With rem Sizing

This page uses a 12pt page font, so **1rem = 12pt**. The built-in heading aliases below expand to **<label>**, and each heading spells out its rem multiplier so the rendered scale is easy to verify.

Page-root scale

Each alias below uses the same 12pt page root.

h1 — 2rem = 24pt

Largest level.

h2 — 1.75rem = 21pt

Strong section heading.

h3 — 1.5rem = 18pt

Common subheading size.

h4 — 1.25rem = 15pt

Just above body copy.

h5 — 1.125rem = 13.5pt

Matches the root size in bold.

h6 — 1rem = 12pt

Smallest custom heading.

Nested body at 0.75rem

This panel reduces its inherited body text to **0.75rem = 9pt**. The headings below should still resolve against the 12pt page root.

Nested h2 stays 21pt

The body copy in this card is smaller, but the rem heading still resolves against the page root rather than the local panel font.

Nested h4 stays 15pt

This matches the left-column h4 even though the paragraph text is 9pt.

Nested h6 stays 12pt

The smallest heading still sits above the local body size, which makes the page-root behavior obvious at a glance.
