

Advanced SVG rendering

This sample compares the same shared SVG fixtures rendered through LTML's built-in `<svg>` widget and the SVG-backed `<image>` path.

Gradients, opacity, `<use>`, and clip paths

The first fixture exercises `gradientUnits="userSpaceOnUse"`, `gradientTransform`, `stop-opacity`, and reused geometry clipped through a referenced shape.

Advanced SVG rendering

Masks and hard-light blending

The second fixture keeps the current mask markup style in view, including the supported filter-prep structure and a hard-light overlay rendered through both LTML entypoints.
